

# Four-Point Flexural Test - Laboratory Parameter Sheet

## Fixture setup

| Item                                                   | Setting | Unit | Verified / measured value |
|--------------------------------------------------------|---------|------|---------------------------|
| Left support to left loading point                     | 20.00   | mm   |                           |
| Distance between loading points (inner span <b>L</b> ) | 20.00   | mm   |                           |
| Right loading point to right support                   | 20.00   | mm   |                           |
| Distance between support points (outer span <b>S</b> ) | 60.00   | mm   |                           |
| Loading-roller radius                                  | 2.25*   | mm   |                           |
| Support-roller radius                                  | 2.25*   | mm   |                           |
| Four-point fixture ID                                  |         | -    |                           |

\* The historical three-point report used a 2.25 mm radius; verify the actual four-point fixture.

The loading-head speed of **2.50 mm/min** was converted for the four-point geometry ( **S=60 mm** , **L=20 mm** ) to maintain the same nominal outer-fibre strain rate as the historical three-point test ( **S=40 mm** , **1.00 mm/min** ).
